Member Service Performance Dashboard · Screenshots of key interactive states

Native file: Member_Service_Dashboard.html (self-contained, opens offline in any browser; no external links).
Option used: browser-based local interactive dashboard.

1. Overview (default: Jan–Apr baseline vs May–Jun). The headline shows that average wait is on target while the tail (waits > 2 min) and abandonment rose. KPI tiles show actual vs target and status (icon + label); the attention list flags the hot spots.

2. Drill path, step 1: from the underperforming Abandonment KPI, 'Drill into Phone' (97% of the change) and switch the driver view to Product. Credit Card is the top contributor.

Monthly trend: Abandonment

No formal target for this KPI. Shaded = compare period.

What needs attention

Compare period vs baseline, within current filters. Click an item to investigate it.

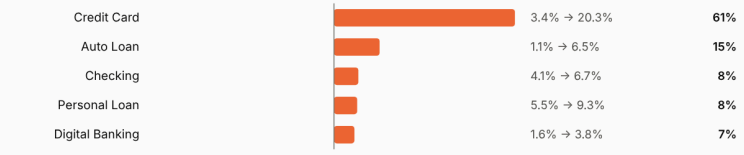

- **Resolution** missed target: 75.4% vs 82.0% — Investigate →
- **Transfer** missed target: 8.5% vs 8.0% — Investigate →
- **Avg wait** missed target: 83s vs 65s — Investigate →
- **Satisfaction** missed target: 2.47 vs 4.20 **(low coverage, see limits)** — Investigate →
- **Waits > 2 min** worsened: 0.1% → 26.1% (no formal target) — Investigate →
- **Abandonment** worsened: 3.1% → 9.6% (no formal target) — Investigate →
- **Same-reason repeat (7d)** worsened: 6.0% → 9.0% (no formal target) — Investigate →

What drove the change in abandonment: Jan–Apr → May–Jun

Each bar is that group's contribution to the overall change (mix + rate; the bars sum to the total). Click a bar to drill into it.

Biggest driver: **Product = Credit Card** explains 61% of the +6.5 pts change. Drill into Credit Card →

Product 61% | Reason 56% | Team 42% | Segment 45% | Region 38%

Made it worse | Made it better | Total change: +6.5 pts

Channel × Product | Channel × Reason

	Auto Loan	Checking	Credit Card	Digital Banking	Personal Loan
Phone	6.5%	6.7%	20.3%	3.8%	9.3%

Worse than baseline | Better | Fewer than 30 contacts (not shaded)

Data limitations · read before acting

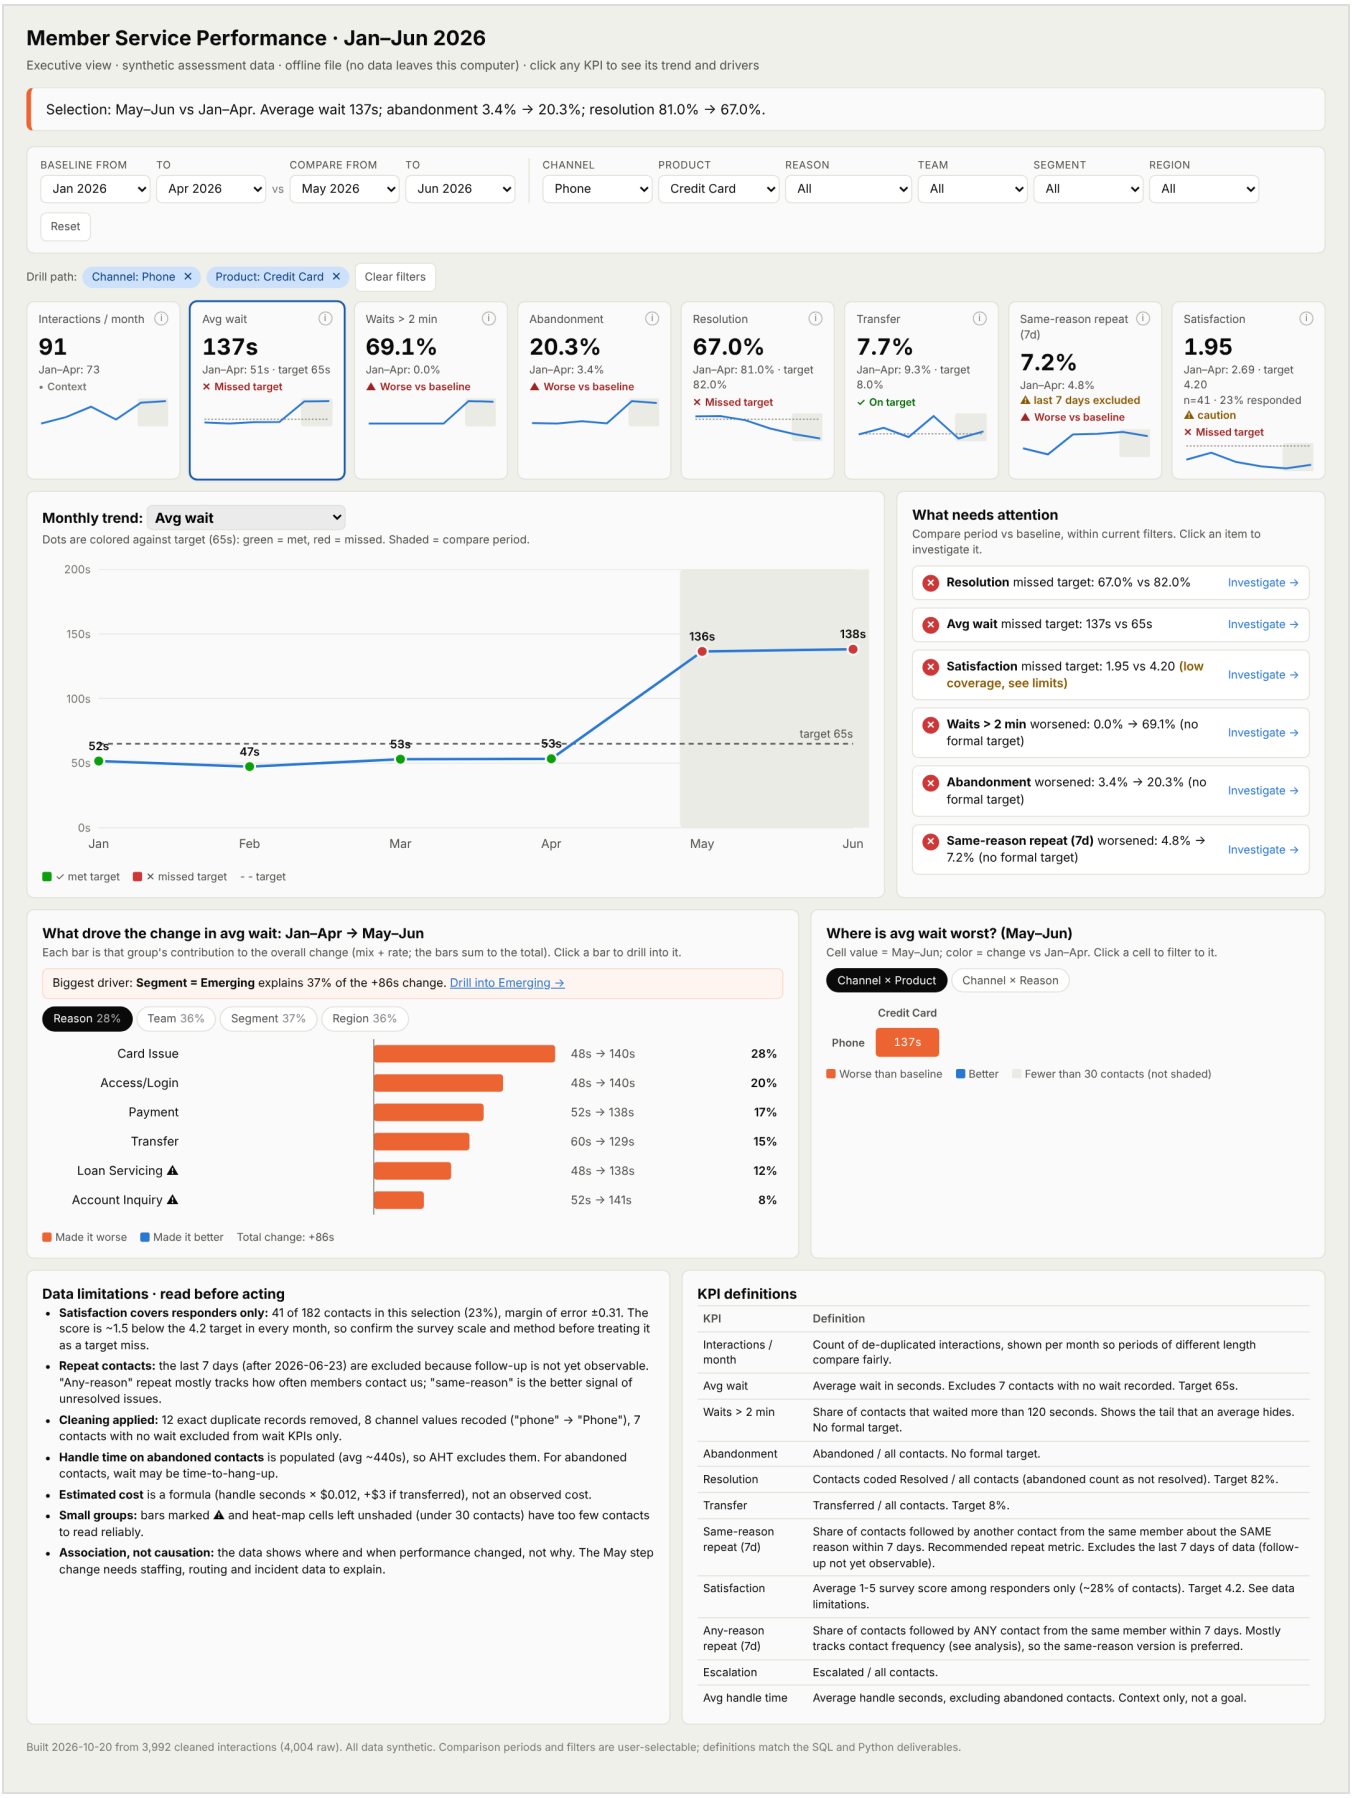

- **Satisfaction covers responders only:** 218 of 769 contacts in this selection (28%), margin of error ±0.17. The score is ~1.5 below the 4.2 target in every month, so confirm the survey scale and method before treating it as a target miss.
- **Repeat contacts:** the last 7 days (after 2026-06-23) are excluded because follow-up is not yet observable. "Any-reason" repeat mostly tracks how often members contact us; "same-reason" is the better signal of unresolved issues.
- **Cleaning applied:** 12 exact duplicate records removed, 8 channel values recoded ("phone" → "Phone"), 7 contacts with no wait excluded from wait KPIs only.
- **Handle time on abandoned contacts** is populated (avg ~440s), so AHT excludes them. For abandoned contacts, wait may be time-to-hang-up.
- **Estimated cost** is a formula (handle seconds × $0.012, +$3 if transferred), not an observed cost.
- **Small groups:** bars marked ▲ and heat-map cells left unshaded (under 30 contacts) have too few contacts to read reliably.
- **Association, not causation:** the data shows where and when performance changed, not why. The May step change needs staffing, routing and incident data to explain.

KPI definitions

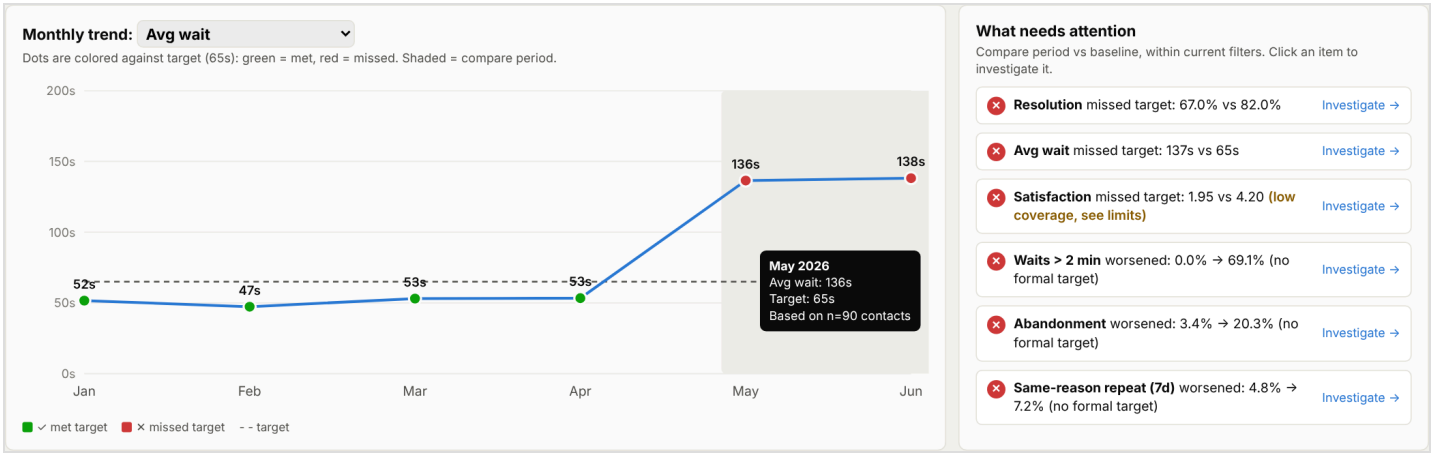

KPI	Definition
Interactions / month	Count of de-duplicated interactions, shown per month so periods of different length compare fairly.
Avg wait	Average wait in seconds. Excludes 7 contacts with no wait recorded. Target 65s.
Waits > 2 min	Share of contacts that waited more than 120 seconds. Shows the tail that an average hides. No formal target.
Abandonment	Abandoned / all contacts. No formal target.
Resolution	Contacts coded Resolved / all contacts (abandoned count as not resolved). Target 82%.
Transfer	Transferred / all contacts. Target 8%.
Same-reason repeat (7d)	Share of contacts followed by another contact from the same member about the SAME reason within 7 days. Recommended repeat metric. Excludes the last 7 days of data (follow-up not yet observable).
Satisfaction	Average 1-5 survey score among responders only (~28% of contacts). Target 4.2. See data limitations.
Any-reason repeat (7d)	Share of contacts followed by ANY contact from the same member within 7 days. Mostly tracks contact frequency (see analysis), so the same-reason version is preferred.
Escalation	Escalated / all contacts.
Avg handle time	Average handle seconds, excluding abandoned contacts. Context only, not a goal.

Built 2026-10-20 from 3,992 cleaned interactions (4,004 raw). All data synthetic. Comparison periods and filters are user-selectable; definitions match the SQL and Python deliverables.

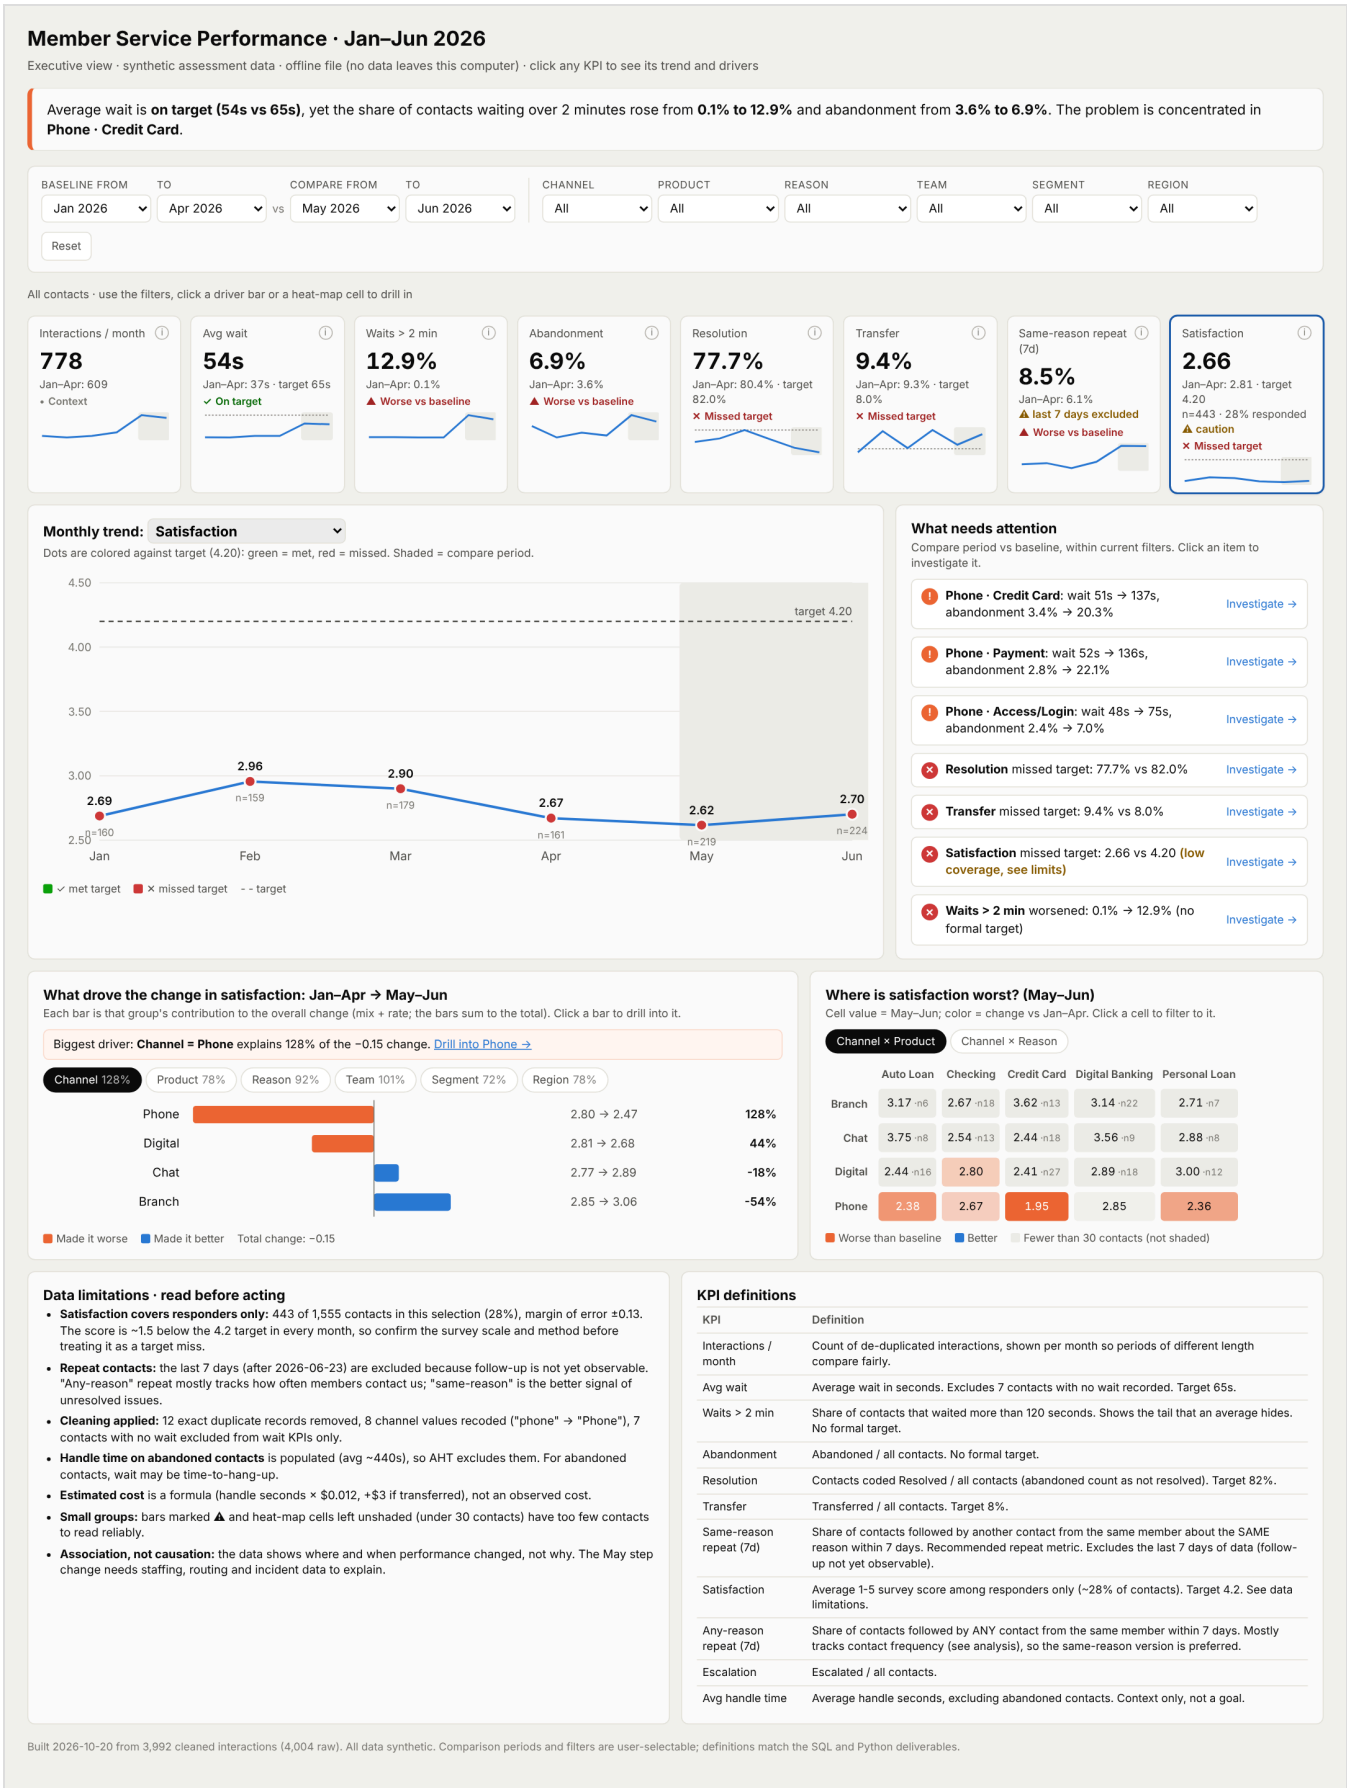

3. Drill path, step 2: click Credit Card. Filters now show Phone · Credit Card. Avg wait missed target in May–Jun (51s → 137s), 69% wait > 2 min, abandonment 3.4% → 20.3%.

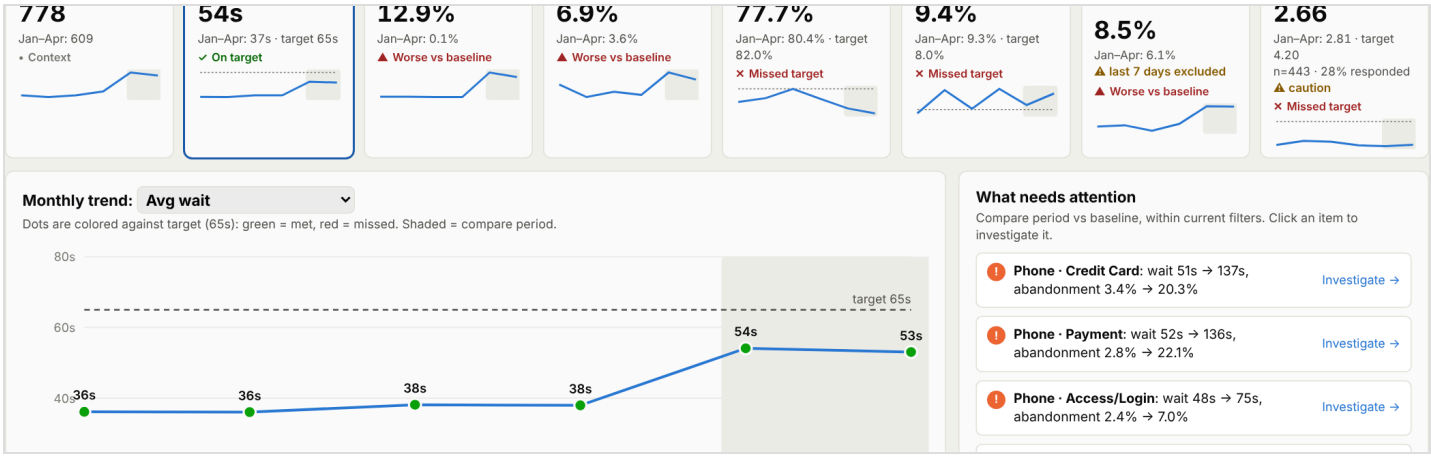

4. Hover tooltip on the trend: value, target and sample size for each month. Dots are green/red against target.

5. Satisfaction view: response count, response rate and a caution flag on the tile; n is printed under each monthly point; the limitations panel shows the margin of error.

6. Heat map (Channel × Reason, avg wait): Phone · Payment stands out (52s → 136s). Cells with under 30 contacts are not shaded and show their n.

7. Clicking an attention item ('Phone · Payment') applies the filters and opens the abandonment drivers for that hot spot.
